

Daniel Golan

A. Test this UI mock-up

Security

- **No CVV/CVC field** - this is mandatory for any card transaction. It's a security and compliance gap.
- **Card number shown in plain text** - The mockup does not show any masking on the card number field - this should be verified in the actual implementation. If it's not masked, it's a bug.

Functional

- **No card number format validation** - It is not clear from the mockup whether card number validation is implemented. Should be verified that the field rejects letters/special characters and enforces 16 digits.
- **No CVV field** - payment processors will reject the transaction.
- **"State or Province" dropdown** — many countries have no state/province and it is marked as a required information.

Usability

- **No input mask on card number** - should auto-format as 4242 4242 4242 4242
- **Payment amount shows 30.00 with no currency symbol** - Not clear what coin is that.
- **"MI" field** - confusing for non-US users, no tooltip or explanation
- **No show/hide toggle on card number** - standard in modern payment forms

Performance / Accessibility

- **No inline error messages** - asterisk * alone doesn't explain what went wrong or what is expected to get.

UI

- **Labels may not be programmatically linked to inputs** - It should be organized by subject groups.
- **Missing asterisk * to "month" path** - if all the required information inputs gets * it should be also in the "month" input
- **change position between the city and the street address areas** - It's standard to write first the city and then the address

B. Test cases

ID	TC_1
Title	Successful payment submission
Pre-conditions	Go to the billing section, the form is empty
Test steps	1. Select card type 2. Enter valid credit card number (16 digits), month and year Enter First name, Mi, Last name. 3. Enter Street address, city, province and postal code. 4. Click on "Continue"
expectations	Payment is processed successfully and user is redirected to a confirmation page

ID	TC_2
Title	Missing required fields
Pre-conditions	Go to the billing section, the form is empty
Test steps	1. Leave all fields empty 2. Click Continue
expectations	Form is not submitted, all required fields (marked with *) are highlighted with an error message

ID	TC_3
Title	Card number masking
Pre-conditions	Go to the billing section, the form is empty
Test steps	1. Click on the card number field. 2. Enter a full 16-digit card number: 4111 1111 1111 1111. 3. Click outside the field or move to the next field. 4. Observe the displayed value in the card number field.
expectations	The first 12 digits are masked (e.g. **** **) and only the last 4 digits 1111 remain visible. The full number should never be displayed in plain text.

C. Solution for the most severe bug

The bug of cvv input not existing is definitely the highest severity because the payment will not work without it.

I suggest a solution, to add a path for the cvv of the card. by that, there will be all the data that we will need to make the payment successfully.
